COCONUT WATER

Coconut water is the clear liquid inside young green coconuts (fruits of the coconut palm). In early development, it serves as a suspension for the endosperm of the coconut during the nuclear phase of development. As growth continues, the endosperm matures into its cellular phase and deposits into the rind of the coconut meat. Providing 19 calories in a 100 ml amount, coconut water is 95% water and 4% carbohydrates, with protein and total fat content under 1% each (table). Coconut water contains no vitamins or dietary minerals in significant content (all under 10% of the Daily Value, DV, table). Coconut water has been used rarely as an intravenous rehydration fluid when medical saline was unavailable. Coconut water has long been a popular drink in the tropical countries where it is available fresh, canned, or bottled.

Coconuts for drinking are served fresh, chilled or packaged in many places. They are often sold by street vendors who cut them open with machetes or similar implements in front of customers. Processed coconut water for retail can be found in ordinary cans, Tetra Paks, or plastic bottles, sometimes with coconut pulp or coconut jelly included.

Coconut water can be fermented to produce coconut vinegar. It is also used to make *nata de coco*, a jelly-like food.
